EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows: page 1, line 17, "synchronizationpattern" was changes to -- synchronization pattern -- and page 14, line 19 "issimilar" was changed to - is similar --.

The following is an examiner's statement of reasons for allowance: the cited references fail to teach

"a number of detecting elements coupled in a series configuration corresponding to a predetermined bit in the predetermined pattern of bits, each detecting element configured to present an output configured to indicate a number of mismatches between (i) the data bit received at the first input in a current detecting element and (ii) the corresponding predetermined bit in the predetermined pattern of bits received at the second input in previous detecting elements"

as in applicant's claim 1 or

"means for generating, in each detecting element in the series of detecting elements an error signal indicative of the number of mismatches between the received data bit and the corresponding predetermined bit in the predetermined pattern detecting elements in the element in the current clock cycle, in previous series in previous clock cycles and in the current detecting element in the current clock cycle"

as in applicant's claim 12.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. McClure shows the use of parallel groups of serial comparators for increased speed. Cantrell shows a plurality of n numbers, each representing a particular data observation, being sequentially entered into a plurality of serially connected storage registers, as each new observation is entered, it is compared with the previous observation to determine its magnitude relative to each other observation of the data set. Evans shows an AND gate 115 providing a true output if input and stored characters match and the input result on the previous cycle was true. Min et al. shows, in Fig. 5, a pattern recognizer.
